Joins

What is Join?

A **JOIN** clause is used to combine rows from two or more tables, based on a related column between them.

Types of Joins in MySQL

- **INNER JOIN**: Returns records that have matching values in both tables
- **LEFT JOIN**: Returns all records from the left table, and the matched records from the right table
- **RIGHT JOIN**: Returns all records from the right table, and the matched records from the left table
- **CROSS JOIN**: Returns all records from both tables
- **SELF JOIN**: Returns all records from Single tables
- **EQUI JOIN**: Returns all records from both tables using =(equal to) operator.
- **Non-equi JOIN**: Returns all records from both tables using <,>,<=,>=,!= operators.
- **Natural JOIN**: Returns all records from both tables same like innr join.

LEFT JOIN

RIGHT JOIN

CROSS JOIN

```
select  
employees.emp_id,employees.emp_name,departament.department_nam  
e from employees inner join departament ON  
employees.department_id=departament.department_id;
```

```
select e.name as employees2, m.name as manager
```

```
from employees2 e
```

```
left join employees2 m ON e.emp_id = m.manager_id;
```

```
select orders.order_id,orders.amount ,customers.cust_name from orders
right join customers on orders.cust_id=customers.cust_id;
```

```
select
employees.emp_id,employees.emp_name,departament.department_name
from employees left join departament on
employees.department_id=departament.department_id
```

union

```
select
employees.emp_id,employees.emp_name,departament.department_name
from departament right join employees on
departament.department_id=employees.department_id;
```

Equi join

```
select *from state,city where state.state_id=city.city_id;
```

Non-Equi Join

```
select *from test1,test2 where test1.s_no>test2.s_no;
```

Self Join

```
select e.name as employees2, m.name as manager
```

```
from employees2 e
```

```
left join employees2 m ON e.manager_id = m.emp_id;
```
